# GLADLAND ACRES

*Lebanon, Oreg*

Oregon Grown  
Superior Gladiolus

1952

LEBANON, OREGON

## THE 1952 GLADLAND ACRES CATALOG

In presenting our variety list for 1952, it would be very pleasing if we could afford the space to give you a word picture of each variety in detail; as each of the 677 varieties herein listed, naturally has some special attribute that is responsible for its appearance in our list of offerings. Such a presentation is impossible within the budget limits which we can afford for catalog expense. We have given you a complete breakdown by color classes and further segregated by floret sizes, and with the information as to number of days required to bring into bloom, the average number of buds per spike and the average number of florets opening and holding in good condition, together with name of originator and year of introduction, you will be able to make intelligent selections. As we see them, every variety listed is a superior one in some respect and we do not believe that you could pick a poor one from the entire group.

If you grow principally for flower show competition, you will be interested in our suggested list of varieties most apt to win blue ribbons. This is based on performance in our gardens here, and in most classes alternates from our list might perform better in your locality. If you grow for home decoration you will find that the 300 size class (Medium size florets) together with the small and miniature varieties will actually be more useful than those with the giant and large size florets. However there is a thrill in growing these new modern Giants. that will doubtless keep them tops in popularity for a long time.

We have added a very considerable number of varieties to our list this season. All of these have the name printed in CAPITAL LETTERS with an "\*" symbol for easy identification. There are no quantity discounts on any of these varieties so marked. On all others — quantity discounts are 20% from the each price for 5 or more of a single size and kind. 36% discount from the each price for 25 or more of a single size and kind.

Orders for less than \$5.00 net, are not prepaid, nor are items on which you take the 36% discount. In such cases we will expect you to remit to us on receipt of the bulbs, the actual postage cost incurred by us in mailing. Orders totaling \$5.00 or more, selected at each or ten rate, will be mailed at our expense. All orders will be shipped on the date you specify (beginning Dec. 1st); however if desired before March 1st, they will travel at your risk of freeze damage.

### A SPECIAL OFFER OF GLADLAND SEEDLINGS ORIGINATED BY PAUL V. BAKER

This season, following a hybridization program during which we have grown literally thousands of seedlings we expect to send out to about 50 customers only, a set of 3 different seedlings which we plan to introduce formally in 1953 and 1954. These will be sent out under number and the names to be used will be later sent to each customer.

The price per set of 3 — \$3.00. This is a net price and not subject to discounts of any kind. If any or all of them do not perform as you would wish, the bulbs and increase may be returned for full credit. Naturally several returns of a single variety would cause us to decide that such seedlings should not be further distributed. Your frank opinion as to the merits or faults of these will be greatly appreciated.

WE SCHEDULE 2 ORIGINATIONS OF MRS. WALTER WERTH OF OREGON FOR INTRODUCTION IN 1953.

Class 412 (80 days) This very clear, clean medium deep yellow self, with no markings, opens 6 ruffled florets of 19 buds. This seems to be the best large yellow we have grown here and has been consistently excellent both this summer and the summer of 1950.

Class 542 (85 days) Giant ruffled pink, with large white throat area. Easily opens 8 of its 21 buds, in 100° heat. Tall, vigorous grower, perfect formal placement. Looks like a sure show-winner.

We will supply these for \$2.00 per set of the 2 varieties, to about 40 of our customers, this season for trial plantings. Doubtless this quantity will be very quickly reserved. Prices NET and only one set to a customer.

## OUR HEADLINE 1952 INTRODUCTION

### BETSY ROSS (Class 462). Originated by A. D. Zimmerman

This bright and unique glad was the center of attraction in our trial garden. Rather irregularly striped rose-red on a white background it was suggestive of the red and white striping of our American flag, consequently the name "BETSY ROSS." It opens 7 florets on a 19 to 20 bud spike in 80 days. Very colorful, and if you like them different and gay, it will appeal to you. Priced at \$1.00 per bulb any size, but because of the very small quantity available we will have to ask 25c for each bulblet of this.

### THE GODDARD VARIETIES (From British Columbia)

Catalogued and grown in the United States for the first time, we regard these originations as being very fine indeed. Aero produced the largest florets of any white we grew with a height and length of flowerhead that was in proportion. All have show-winning quality. A special group offer at a special price to induce you to try them this year. All large size bulbs in this collection offer.

ATTRACTION (566), WHITECLIFFE (501), SILVER MOON (400), CHERUB (301), ORCHID MONARCH (566), AERO (501). This group of six, each priced separately at \$1.25 — a regular value of \$7.50 for only \$6.00.

### GROUPS THAT DESERVE SPECIAL MENTION

Our Oregon spring was early this year. Our field plantings started March 21st, were completed May 10th, and already at this writing (July 12) we have been able to check field performance on all varieties that bloom in 85 days or less. Extremely low humidity coupled with temperatures in the high nineties has given us some data on heat resistance, and a few seedlings which otherwise seemed almost perfect have been eliminated from further consideration by us.

Combining last summer's reports with this season's records of bloom to date, we find the Burn (N.Z.) and the Burns (Aust.) groups are very impressive, and certainly most of them will prove garden favorites. MRS. RHODA PETERSON is certainly the finest smoky that has come to us from Australia, and Pfitzer's TOBRUK by far the finest black red in the 400 size. PHAROAH made extensive winnings last summer and is a must in the giant salmons. GRAND FINALE, our first release, finally has been distributed widely enough to allow its appearance on the show tables, and it won consistently.

### BULBLETS

We are prepared to furnish bulblets of every variety we list, altho to save on printing costs these are not listed or priced. Bulblet orders of less than 25c per variety cannot be accepted. Prices on the newer varieties are normally based on 10 bulblets for the price of a large bulb. On older, lower priced varieties, 25c packets will contain up to 100 bulblets, the quantities varying according to the list price and the bulblet propagation productiveness.

### SEEDLING BULBS — BULBLETS — and SEED

(A) We offer bulbs grown from bulblets of our 1949 seedling crop for \$1.00 per 10 bulbs. Bulblets from this same stock for \$1.00 per 100. (A mix from 4000 different seedlings.)

(B) Bulblets from our 1950 seedlings — 50 for \$1.00. (A mix from 9000 different seedlings.)

(C) SEED — from latest introductions in our trials — per package of 15 seed — 25c. Per packet of 100 seed — \$1.00.

THE CLASSIFICATION CODE NUMBERS USED IN OUR DESCRIPTION OF VARIETIES ARE TAKEN FROM THE 1951 NAGC SELECT LIST. Note that an odd number in the final digit indicates that the variety is conspicuously blotched or feathered. Following the dash after the 3 digit class number we give you the average number of days required to bring the variety into bloom, when large bulbs are planted.

#### SMALLS (200 Under 3½ Inches and MINIATURES (100) Under 2½ inches.

95% of our stocks of these most popular sizes are grown from bulblets as we sell out so closely each year. We quote all sizes at same price. Largest bulbs (if requested) go to earliest buyers. No quantity discount of these except as listed. Most of the 300 size may be used in miniature arrangements, especially tip blossoms from small size bulbs. Up until this season we listed the smaller floreted varieties of the 300 class, such as Lavender & Gold, Rose Gem, Golden Frills, Hocus Pocus, with this small size class.

## GROW GLADIOLUS FOR PROFIT AS A PART-TIME PASTIME

This article is an attempt to answer the questions most often asked by many of our customers. The growing of Glads is so simple, and the spikes are so well adapted for flower-arrangements and florist use, that in terms of revenue received, the Glad is the top-income producer of all cut-flowers, not even excepting the rose. We think that these questions asked by many "fans" who desire not only to make their hobby pay its way but also to provide a little extra spending money, merits thoughtful, intelligent answers.

Growing glads for profit — is not a "get-rich-quick" project. On the other hand, if you can be satisfied with from \$100 to \$500 extra income each summer for only a few spare-time hours each week, and have available from 400 to 2500 square feet; then this amount of extra income is not only possible but is in fact received by many of our Gladland customers.

### AN INVESTMENT IN GLADIOLUS FOR CUT-FLOWERS IS NOT HAZARDOUS

A minimum planting for cut flower sales, will require about 400 square feet of ground. This will

allow the planting of a complete color range, with a large enough quantity of each to provide several dozen spikes of one variety. Such a group in first quality bulbs, in the preferred planting sizes and varieties, cost at the present time slightly less than 30c per dozen, including transportation expense. But since you can reasonably expect to harvest three crops of bloom from them (one crop a year for three years) your actual bulb cost over the full period is only about 10c per dozen. If you have sold only 60% of the first season's bloom at an average of \$1.00 per dozen, you will not only have covered your initial investment, but will have received besides nearly 100% cash profits and for the next two years any sales of flowers from this original bulb stock are actually all gross profit.

WE GIVE LIBERAL CREDIT TERMS WHEN YOUR PURCHASE IS FOR A QUANTITY OF 250 OR MORE DOZEN.

We have found in the past that many of our customers who most needed some extra income, could not conveniently advance the amount necessary to

cover in full the cost of bulbs and the delivery charges. In every instance to date, every customer to whom we have extended credit for such purposes has paid us their balance in full without any necessity for us to make any special collection efforts. For this reason when bulbs are purchased for cut-flower production and in sufficient amount that we are justified in the extra bookkeeping records we furnish on the following terms: One-third down, one-third August 15th, and the balance September 15th. A very nominal carrying charge is added for the credit service. By making the payment time due during the cut-flower season, your income from the sales should enable you to make the deferred payments from monies actually received from your customers. We of course having no control over weather conditions, and your sales outlets, consider this a normal sale and payments due will not be contingent on your sales income. As a matter of sound business, we require you to give us promissory notes for each of the two payments due, with no interest unless not paid at maturity. Under normal procedure we assign these notes to our bank for collection.

### WHERE TO SELL CUT-FLOWERS

The sales outlet depends largely upon your location, and upon the contacts you have or make. Many of our customers prefer to supply their local florists. Florists always prefer high-quality home grown gladiolus when these are available. They have no shipping expense, the flowers are always fresh and completely useable, and they are more satisfactory to their customers. The prices they will pay of course depends upon the market conditions. The local season usually opens at around \$1.50 per dozen. Within a couple of weeks when the main cut is available the price usually drops to around \$1.00 and later in the season when the large commercial growers throw their big supplies on the market it can drop to 75 or 50 cents per dozen. In the smaller communities you should especially bear in mind that the local florists buy glads almost wholly for funeral work, altho weddings require quantities as do special events, such as opening of new businesses, etc. If one relies wholly on the local florist to absorb your cut, there are almost always periods when perhaps your bloom is heaviest, when he will be unable to use all of them. It is always wise to build up a group of direct-user retail customers, unless your florist agrees to take your entire cut.

As cut flowers for the home, the glad will easily last a full week if the housewife will use them in low arrangement, using the tip flowers when the lower florets have withered. Taking advantage of this cut-flower durability some of our customers have built up a regular clientele who buy one dozen each week thru the entire cutting season and it is a very simple matter to furnish from a dozen to 50 families each week on such a program. We have published a 44 page booklet, "Artistry in Gladiolus Arrangement," price 50c, to encourage an increased use of Glads in the home.

Another field is the supplying of offices, stores, hotels, restaurants, with fresh flowers regularly. Glads last so much better than most greenhouse flowers that this group can be easily sold on the plan and it is profitable to supply them. Others report that they follow the news items closely and supply Glads for clubs, weddings, showers, and various

social functions, and of course every hospital room is always filled with flowers which someone furnished. Since glads have no fragrance, they are especially liked by the hospital attendants for this purpose.

Ninety-nine men out of each hundred, nearly always forget birthday and special anniversary dates, and really appreciate a reminder in time to do something about it. If you can obtain those dates lying within your gladiolus cutting season, and will follow up these, you can be absolutely certain of a high percentage of sales from them.

### ROADSIDE STANDS AND SUBURBAN AND COUNTRY SALES

Possibly the suburban and country residents, who live on well traveled roads, have the easiest method of disposing of their flowers. We have checked a number of these outlets and find they are very successful in disposing of rather large quantities of Glads.

Some of them simply use a road sign to announce their willingness to furnish flowers, with preferably a portion of their bulbs growing and blooming within sight of the passing cars. Others with larger plantings, are operating roadside stands that vary from extremely simple construction, to quite elaborate, to display their cut-blooms. And their sales volume, especially at week ends, were actually surprising to us. Oftentimes they combined their offering of flowers with seasonable farm and garden products. Perhaps the most unusual one was a serve-yourself stand on Highway 30, east of Portland. Here there was no attendant, but the stand was well filled with bouquets of glads in varying quantities, each plainly marked as to price. The customer was requested to help himself and drop the price into a slot coin-box. Apparently the plan was a success as the operation continued thru the cutting season.

The ingenious individual will find many, many outlets for his flower production providing it is reasonably priced and of high quality. Good cut-flower varieties may be cut in tight bud (when 3 to 5 buds are showing color but before a floret is actually open, and these if held in storage at flower refrigerator temperature will keep as long as two weeks and still be saleable. This factor makes it possible to hold the spikes for several days if they do happen to bloom at a dull market time. Those cut in tight bud will not open quite as large a floret as those cut when the two bottom florets have opened in the field, therefore for local use when sales are reasonably sure, it is best to make your cut with at least one floret open. It is in an interesting fact that every glad grower should know, that the floret opening takes place only at night. When you observe your spikes in the morning, they then show all of the florets that will be open that day.

### IMPORTANCE OF PROPER VARIETY SELECTION

The choice of varieties is one of the important questions which must be answered correctly if your cut flower crop is to prove profitable. A cut flower variety sells most readily if the flower size is in the 400 or 500 class. The colors must be clear and pleasing; the texture of the floret of sufficient dura-

bility that it will not wilt quickly; the attachment of the floret to the stem should be such that, it will not break off easily in handling; the spike must have the ability to open and hold in good condition — at least six florets — and if it can open more, so much the better. The variety must be capable of opening all of its buds in water when cut with one bud only partly open. If your market is to wholesale florists your varieties must be good shippers. Preferably the spike should be tall altho some of the most beautiful and desired varieties as Elizabeth the Queen, are on the short side. The stem should be stout, and wiry, so that it droops less quickly in the field. The growing habits are quite important—the variety should be healthy and vigorous with the ability to produce almost 100% of good spikes from the bulbs you plant. Some of our loveliest varieties are temperamental— blooming beautifully and generously some seasons — in others proving most disappointing. A cut flower variety to be profitable must be dependable. Above all, the varieties must be superior to those which have been generally grown in the past. In a dull market the old well known varieties cannot compete with the newer varieties which have been developed. Keep your variety list just a year better than the common run that growers have in their fields and you will have no marketing problem. Be sure that each year you try out a few new ones — not too many of each — until you see how they behave in your soil. Of those that prove better than the ones you are already growing — plant generously next year. Don't hesitate to junk an inferior variety — build a reputation for quality spikes.

#### CHOICE OF COLORS

If you plan to sell your spikes to a local florist, he will most probably buy about 25% whites and very light creams, about 50% salmon and pastel pinks, with the remaining 25% of reds, yellows, purples, oranges, etc., combined. He will want mostly self colors, without prominent blotched or throat markings. The reason for his choice of color is the fact that about 75% of his use of gladiolus is for funeral sprays and designs. For weddings he uses mostly whites. When he is supplying baskets for banquets, business openings, and parties, then the bolder colors are desired, with tall spikes bringing premium prices for such use.

If you are selling from a stand or to a public market, where the spikes eventually are used for house decoration, then you will find that almost every color is in demand, and that the warm toned smokies and the brown hues of the 90 color class are very much in demand because they are so different and have such exquisite color blendings. A great field exists in gladiolus sales for the home and office. This field has barely been opened — it can be expanded enormously.

#### QUALITY OF BULBS

The first requisite of success in flower growing, is healthy stock. No amount of care can produce good spikes from diseased bulbs. Never plant one that looks suspicious, for most bulb diseases are highly contagious and may easily and quickly affect your ground and your entire stock. The supplier of your bulb stock should be one on which you can rely not only for honesty but also on his ability to know

gladiolus diseases. Always buy directly from a grower of unquestioned reputation for supplying healthy, vigorous, young disease-free stock.

Gladland Acres is a nationally known firm. Not only are our bulbs of top quality, but no other cataloger in America offers as complete a selection of superior kinds. Your stock as received from us can be depended upon to develop quality spikes and our knowledge of varieties and their performance both in the field and after cutting, makes it possible for us to give you a selection that will produce a money-making crop for you. It is only good business sense that we make every effort to make your initial investment a paying one; because our most valuable assets are our repeat customers, and we know that if you succeed in this project, we can confidently expect that we will continue supplying you with the newer varieties as they develop.

#### SALE OF BULBS

If your sales outlet is in part to individuals, either by solicitation or by means of a road stand, a large percentage of these customers will desire to purchase bulbs for their own garden. With the exception of a few varieties, all in our group offerings retail regularly at \$1.00 per dozen. We strongly urge that you encourage these potential customers— replacing the large bulbs sold with medium size for your next season's flower sales. A gross profit of 70c on each dozen may add materially to your income from gladiolus and it has been our experience that these same customers will buy year after year as they see new varieties in your plantings. Nearly all of the larger gladiolus firms started as amateurs and developed their present business volume over a period of years by gradually increasing their plantings, as they developed a sales outlet.

#### PLANTING TIME AND DEPTH OF PLANT

When glads are grown for bulbs, and bulblet production, shallow planting is best, but for cut flower production, deep planting is necessary, or else spikes will loosen and fall when heavy rains or required water is necessary as the spikes are developing. For large bulbs plant 4 to 6 inches deep; for medium bulbs plant 4 to 5 inches deep. Plant as soon as ground becomes warm. While bulbs may be planted very early, cold ground checks growth development, and blooms will actually be later than when planted later, when growing can start immediately. The way to produce early flowers is to select varieties that require less time to develop bloom. Many kinds require only 65 to 75 days from planting, while mid-season varieties as Picardy under ideal conditions require 90 to 95 days. As a general rule the early blooming varieties are not as good quality as the mid-season and late blooming sorts, but they are apt to bring higher prices as they come into the market when local glads are scarce. By careful selection of varieties the cut flower season from a single planting may extend over a period of more than six weeks, while successive plantings can prolong the cutting season until frost.

#### SIZE OF BULBS TO PLANT

In making up groups of varieties for the beginner in cut flower production, we always supply about 30% of the quantity in large size bulbs, simply be-

cause these larger bulbs will bloom from one to two weeks earlier than a medium size bulb of the same variety. There will be very little difference in the actual quality of the bloom and these larger bulbs are simply an insurance of earliest possible bloom in your neighborhood. While planting depth of these large bulbs should be 5 to 6 inches, we usually cover the bulb very lightly, with not more than an inch of soil and then fill the trench gradually as the spikes appear. This will result in much earlier sprouting as the ground will warm faster. For later purchases in the following years we recommend that you buy only young bulbs of medium size, either size 3 or size 4 — these cost less per bulb — and while it takes them a few days longer to bloom, they will make saleable spikes, and next year will be large bulbs that will bloom a few days earlier. While many varieties, such as Oregon Rose, will make saleable spikes from small bulbs, definitely these cannot compare with spikes grown from larger bulbs of the same varieties, and if you are to establish and maintain a reputation for quality bloom you should be careful that you do not offer spikes of less than good quality.

### CULTIVATION CARE

Where available planting space is limited, medium size bulbs may be planted 8 bulbs to the foot by staggering the bulbs in a double row placement, with row spacing depending upon the cultivation tool. Here at Gladland Acres we prefer a 24" spacing from center to center of row. Cultivation must be thorough and frequent. However, deep cultivation is neither necessary nor even desirable. Watering, if you live in an area of normal rainfall, should not be necessary until development of 5th leaf. The bud spike is then forming within the sheath and frequent and ample water is then essential if you expect to produce spikes of normal and adequate height. Assuming soil is reasonably fertile, it has been our experience that ample water supply is all that is necessary to produce fine spikes, if your variety selection is right and your bulb stock was vigorous.

### CUTTING

As we explained in a former paragraph, cutting may be done in tight bud, when 3 or more florets are showing color, but usually for the local market where flowers are to be delivered to the customer that same day or at least by the day following, about two florets are allowed to open in the field. The preferable time to cut is in early morning as the spikes will then have a maximum of water in the stem, and these are always more rigid before the hot sun begins to evaporate their moisture. In any case no more florets will open before the following morning.

In order not to affect the development of the bulb, the most effective method of leaving sufficient leafage to develop and mature the bulb and still obtain a spike of maximum stem length, is to insert the sharp point of a knife through the leaf sheath into the stem at a point about 8 inches above the ground. If you will then twist the stem gently but firmly it separates at the point of entry of the knife blade and can be pulled through the sheath leaving all of the main feeding leaves intact. The spikes are then bunched into dozens and plunged as soon as possible into cool water. Spikes until sold

should always be stored in an erect position to prevent tip curl. If not marketed immediately, the storage room should be darkened or else lighted with perfect light diffusion otherwise the florets will have a tendency to twist towards the light, thus making a spike with objectionable floret facing. Numerous methods of bunching are used. Commonest is round bunching with florets facing outward; most effective is what we have heard termed the California pack, where the dozen are arranged in line, all florets facing one direction with tallest spike with most open florets placed in center of row, then graduated toward each end. Two ties are made, one just below florets, held in line while tied, and the second at base of stem, which are bunched at this point. With this pack two bunches are placed, florets facing each other, separated by a wadded paper pillow, which keeps the florets from rubbing, and then the two bunches are tied together. It is remarkable how roughly these may be then handled, without damage to open florets or buds. We have seen them stacked, almost like cordwood, in the cutting field where they are usually assembled and tied under a canvas sun screen.

### THRIPS

You can't produce good bloom with thrips working on your plants. First, plant bulbs that are free of thrips; simplest method of storing seems to be dusting with 5% DDT powder. If the bulbs are thoroughly coated (done in small quantities by shaking well in paper sack containing the dust, or in large quantities by using a revolving drum) it seems that no thrips can survive a winter storage. We use a methyl bromide fumigation which kills thrips and eggs, but this requires a fumigation room which costs money to build.

Second, start spraying as soon as the leaves are a few inches high (using DDT or chlordane according to directions on package) and keep it up. Every 10 days is not too often. Even though thrips are all around you, which they probably are, this will keep them under control, so that you may expect perfect bloom. (Note: We do not suggest dusting the growing plant. In our experience this is not always effective — use spray instead.) DDDT spray applied while florets are open, or with buds in color may damage floret, causing it to brown.

### DISEASE PREVENTION

Regardless of source of supply, and even though the bulbs you plant are 100% free from disease, it is always advisable to use a fungicide preplanting dip, to insure as far as possible that the stock remains healthy. We find NEW IMPROVED SERESAN most effective. Use a 15 minute soak (a little more time will not cause damage) and plant bulbs the same day. Use 1 ounce N. I. Seresan, with 2 tablespoons DREFT to act as a spreader to 3 gallons of water. Mix Seresan and Dreft thoroughly while dry, add just sufficient water to make a thin paste, stir until paste seems smooth with no dry particles, then add remaining water. The concentrated paste will burn, so avoid getting this on the hands, after dilution the solution will not be harmful, and bulbs can be planted while wet.

Probably the best booklet on gladiolus disease is that published by the Michigan Agricultural College, East Lansing, Michigan. It may be obtained by request to them, with 25c in coin enclosure.

## BABY GLADS — GLADIOLUS NANUS

These are the much talked about and widely advertised HARDY GLADS which are planted in the fall like tulips and daffodils, and bloom in late spring, two months earlier than the normal large flowering varieties.

We have had many inquiries for these, and after discovering a reliable foreign source of supply at a very favorable price we are importing a limited quantity for delivery in time for your fall planting this season. Available in 5 colors — **White; Rose; Orange-scarlet; Scarlet; Vermillion-red.** While these are being widely advertised at \$5.00 for 3 bulbs, our purchase enables us to offer you A COLLECTION OF 20 BULBS, FOUR EACH OF THE ABOVE FIVE COLORS, FOR ONLY \$5.00, postpaid.

Large bulbs of these HARDY GLADS seem small as compared to the standard kinds, being only about the size of a dime. We furnish large bulbs as long as our supply of this size is available.

These are well adapted for cut-flower culture, stems are thin and wiry and strong, and colors bright and charming. At our price of 25c per bulb you can afford a liberal quantity, and in hundred lots they are even cheaper, only 20c per bulb. Be the first in your neighborhood to grow and exhibit them as they will bloom in time for the regular spring garden shown. Ideal for low bowl arrangements.

Mail your order for HARDY BABY GLADS at once. Be sure to make a separate order for these, as these orders require special handling in our office. You will find the attached order form to be most convenient. Prices are net; Minimum order acceptable is \$2.50.

## BULB DIGGING, BULB STORAGE

Most winter bulb losses are the result of slow drying, and faulty storage conditions. Bulbs should be dug while foliage is still green, and the tops cut off cleanly at the top of the corm immediately. 4 to 6 weeks after flowering, will usually ripen the bulbs, unless frost comes sooner, in which case digging should be done as quickly as possible.

Drying should be rapid — with preferred temperature of 90° for the first 48 hours, with ample air circulation. This degree of heat assists in the more rapid process of development of the cork layers of tissue which the bulb builds to seal itself against the penetration of the various fungus diseases. For small plantings a garage or other room equipped with oil or gas heater is practical. An ordinary fan will give sufficient air circulation if bulbs are spread out thinly in screen bottom or other ventilated trays. In many sections where no rain occurs during the digging season, they may be most easily dried out of doors — but should be screened from direct sun rays which can easily burn the tender tissue, and protected by covering against night dews. As soon as the bulbs are spread out to dry, dust them with 5% DDT powder to eliminate possible thrips damage. If possible keep the temperature at 70° until bulbs are dry enough to clean.

Remove the old corms, adhering at the base of the new one that has formed above it, as soon as it will snap off cleanly. (10 days to three weeks depending upon the drying conditions) This become very difficult if bulbs are allowed to remain uncleaned too long. DO NOT REMOVE ANY OF THE HUSKS AT CLEANING TIME, these are necessary to prevent excessive drying out of the bulb during the storage months. Ideal storage temperature is about 50° with relative humidity of 50. However, if well dried, the stock should keep well in any well ventilated basement or room, in a fairly wide temperature range. Freezing damage begins at about 28° with most varieties.

## BULBLET PRODUCTION

It should be noted that the above recommendations for digging while stocks are still green is to minimize disease infection, however bulblets continue to form as long as any part of the stock is green, and in the case of costly varieties, where a maximum of bulblet increase is desired, the digging should be delayed as long as possible, even though this will probably result in the loss of some bulbs. Ten extra bulblets secured from a high priced new introduction is worth the loss of the parent bulb in such instances, but you should appreciate the fact that bulb losses from such practice are to be expected. In the production of seed, very often the bulb having completed the function of seed creation, has not stored sufficient plant food to enable it to go through a winter of storage. With rare varieties, of which you may have only a single bulb, these should be used only as the pollen parent, unless you are willing to lose the bulb in the process of seed production. Bulbs that you expect to use for a commercial flower crop the next season should never be allowed to make seed.

## SUGGESTED STARTING UNITS

We are using plenty of time, and very careful thought in making the variety selections for these starting units. All are desirable florist varieties; all

will open to the very tip bud in water, when cut when first floret is beginning to open. There are newer varieties of even better quality and performance but they are naturally more expensive at this time. If, as we feel sure it will, your initial planting shows you a substantial profit, then next year you can afford to add some of these improved newcomers that will keep the quality of your flower production, a year or more ahead of the average growers.

Our selection of varieties will depend upon your geographical location and the market for the cut spikes, to whom you expect to appeal. For sale to florists, our selection would follow their normal color requirements; while for direct sale for use in the home, a more complete color range, including more of the smoky and art shades that are so popular for living room and table decoration, would be needed.

**GROUP ONE** — 100 bulbs of 14 varieties; 1400 bulbs to furnish about 116 dozen spikes. We supply 400 bulbs in large size for earliest bloom, 1000 bulbs in medium size for later bloom. CASH WITH ORDER PRICE F.O.B. Lebanon, \$32.00

Note: This group of 1400 bulbs requires about 200 lineal feet of row (space equivalent to 15 ft. by 27 ft.) if planted in stagger row, about 7 bulbs to the lineal foot.

**GROUP TWO** — This group contains 150 bulbs each of 20 varieties; 3000 bulbs to furnish 250 dozen spikes. We supply 900 bulbs in large size for early bloom, 2100 bulbs in medium size for later bloom. CASH WITH ORDER PRICE, F. O. B. Lebanon, \$75.00.
